

**ABSTRACT**

We were asked to solve the problem of nowadays medical consultation, because this lasts too long and the waiting time turns out to be a problem.

Our work team consists of 4 members, a coordinator Kevin Anadon, a subcoordinator Yorel Acosta, a first member Mayza Ferreira and a second member Ignacio Rodriguez.

We implemented numerous methods to carry out this problem, for example planning the activities and following the state of it, making a document that details all the functions of the application, and designing the database.

We found that most doctors and nurses that we interviewed agree on the development of this system.

This project is a good example of a technological solution for a common medical problem that we all suffered.
